

# Chapter 4: CSS

# Contents

- Stylesheet
- Accessibility
- Link CSS with HTML
- Syntax of CSS

# Style sheet

- Style sheet describes how documents are presented on screens, in print, or perhaps how they are pronounced
- Separate structure and presentation
- W3C has actively promoted the use of style sheets since 1994.
- W3C recommends several stylesheets CSS1, CSS2, XPath, XSLT
- CSS especially is widely implemented in browsers.

# Advantage of StyleSheet

## ■ Simple management

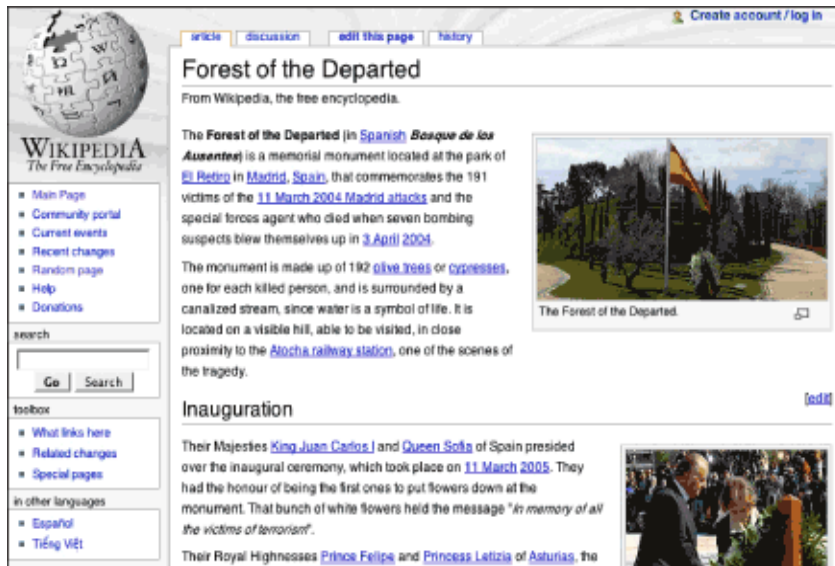

- Separating of presentation result in well-organized content and simple structure.
- Construction and maintenance of the site easier.
  - Change the appearance of the document easily without changing the HTML code

## ■ Consistency in the appearance of the site

## ■ Change style of a page easily

- Switch from a style for the others
- For handicap people and limited user-interface environment.

# Example of page using stylesheet

## Forest of the Departed

From Wikipedia, the free encyclopedia.

The Forest of the Departed.

The **Forest of the Departed** (in Spanish *Bosque de los* Madrid, Spain, that commemorates the 191 victims of the 11 March 2004 Madrid attacks and the special forces agent who died when seven bombing suspects blew themselves up in 3 April 2004.

The monument is made up of 192 olive trees or cypresses, one for each killed person, and is surrounded by a canalized stream, since water is a symbol of life. It is located on a visible hill, able to be visited, in close proximity to the Atocha railway station, one of the scenes of the tragedy.

[\[edit\]](#)

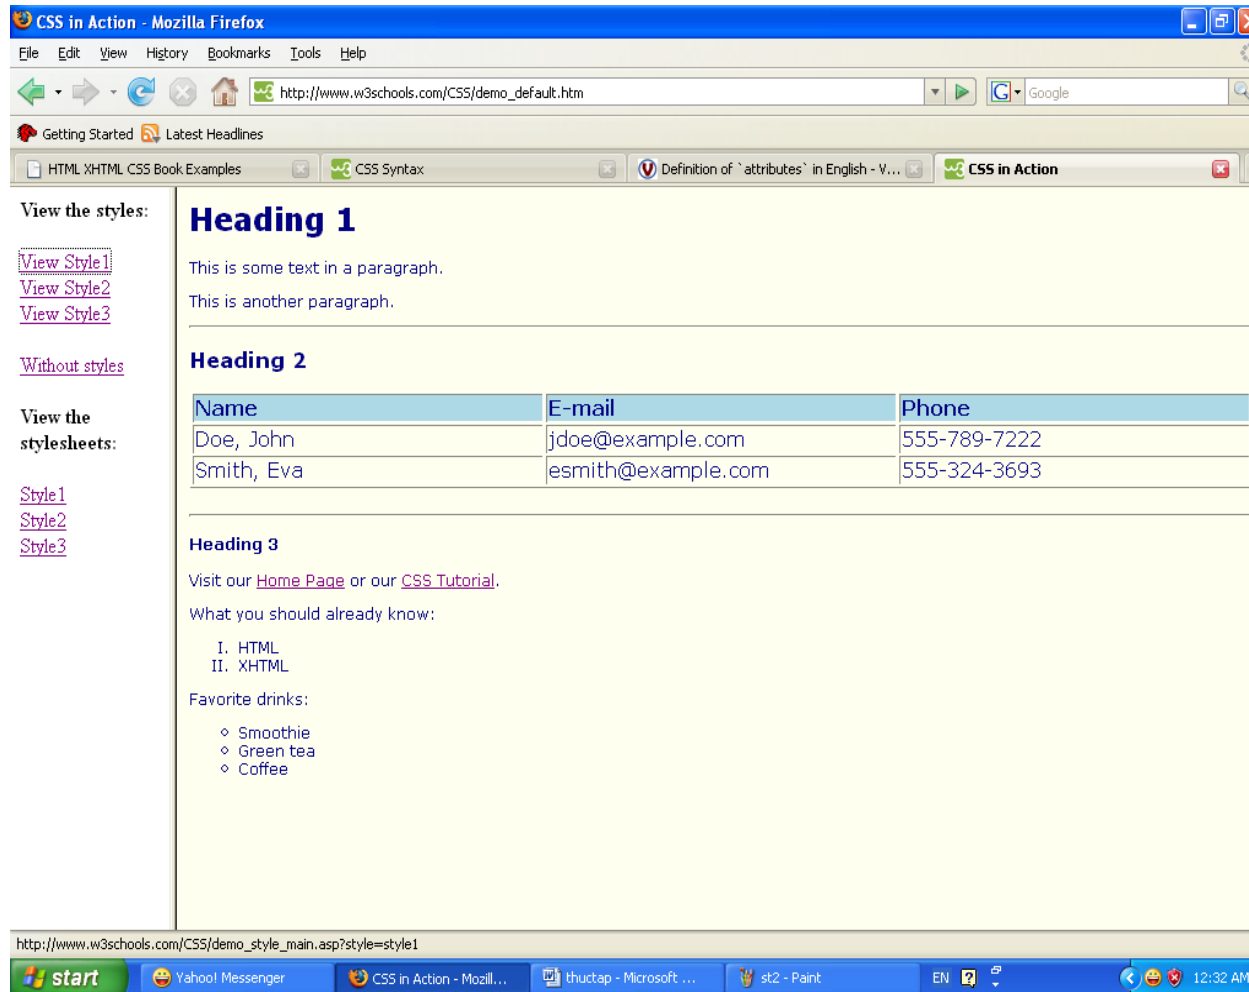

### Inauguration

```
H1 {
  display: block;
  font-size: 2em;
  margin: .67__qem 0 .67em 0;
  font-weight: bold; }
```

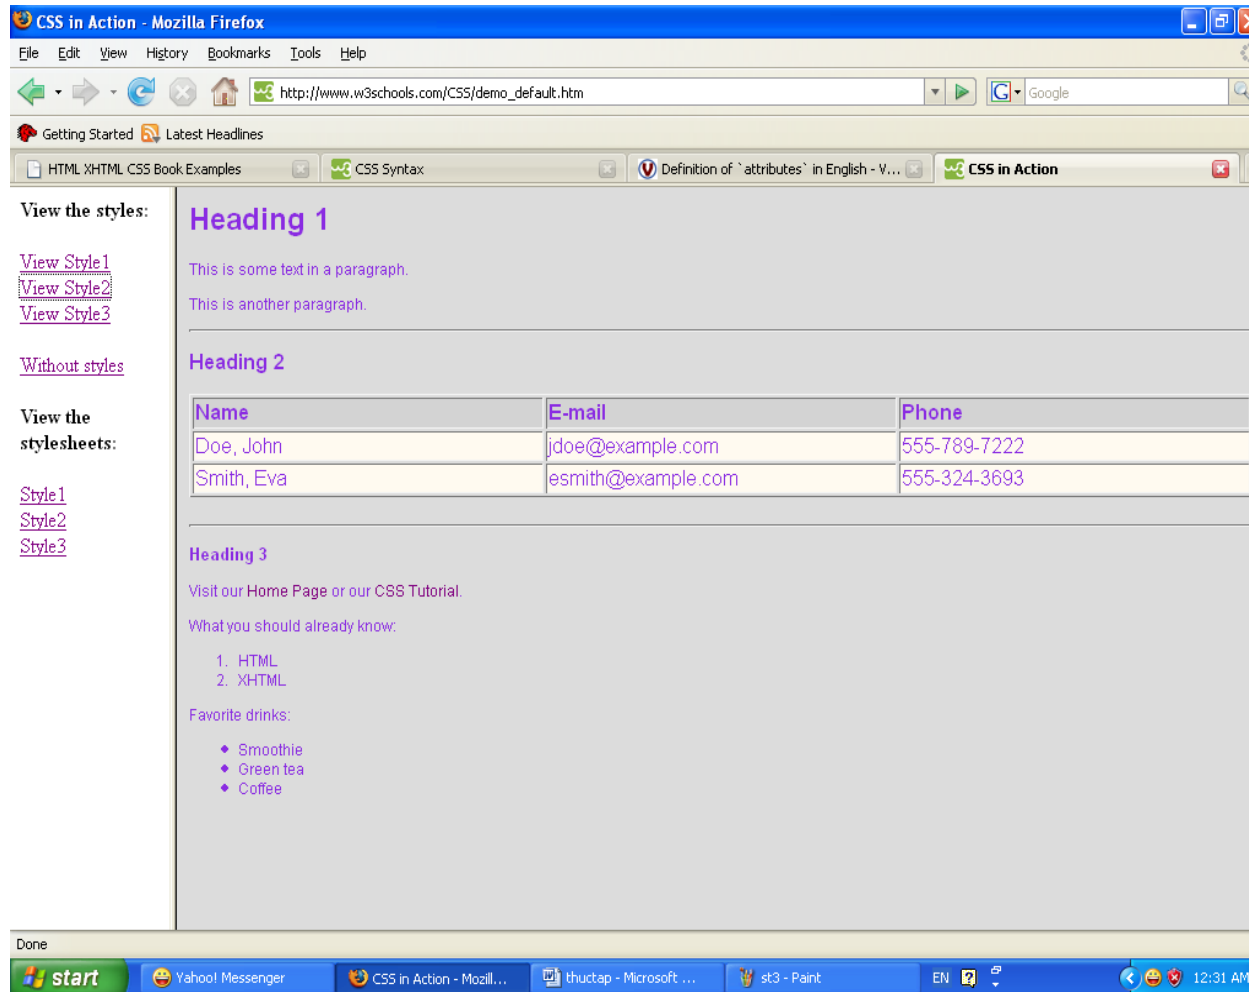

```
H2 {
  display: block;
  font-size: 1.5em;
  margin: .83__qem 0 .83em 0;
  font-weight: bold; }
```

```
p {
  display: block;
  margin: 1.0__qem 0px; }
```

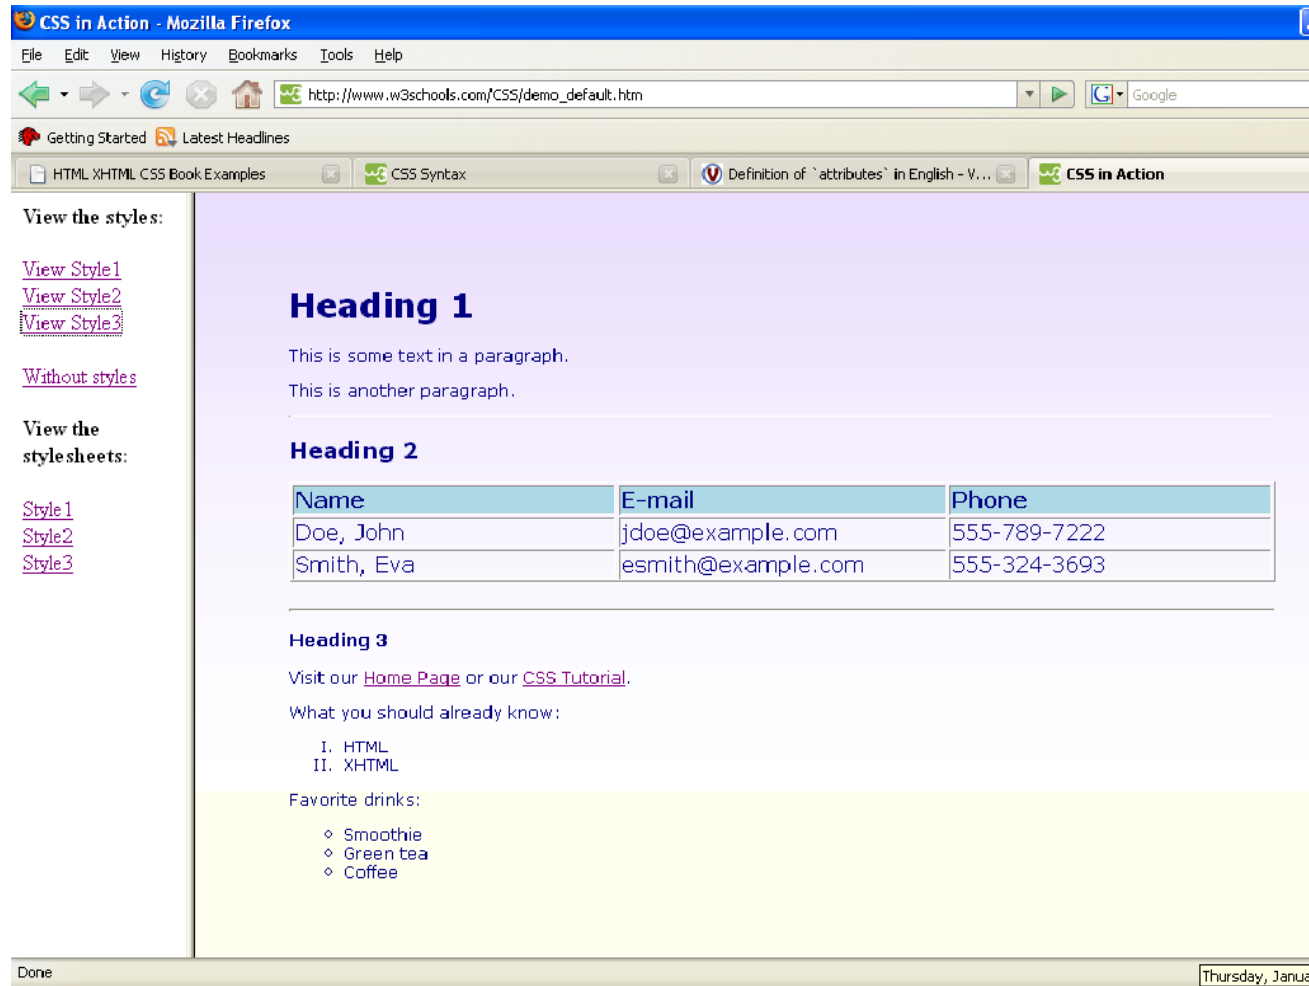

# A document with different style

# A document with different style

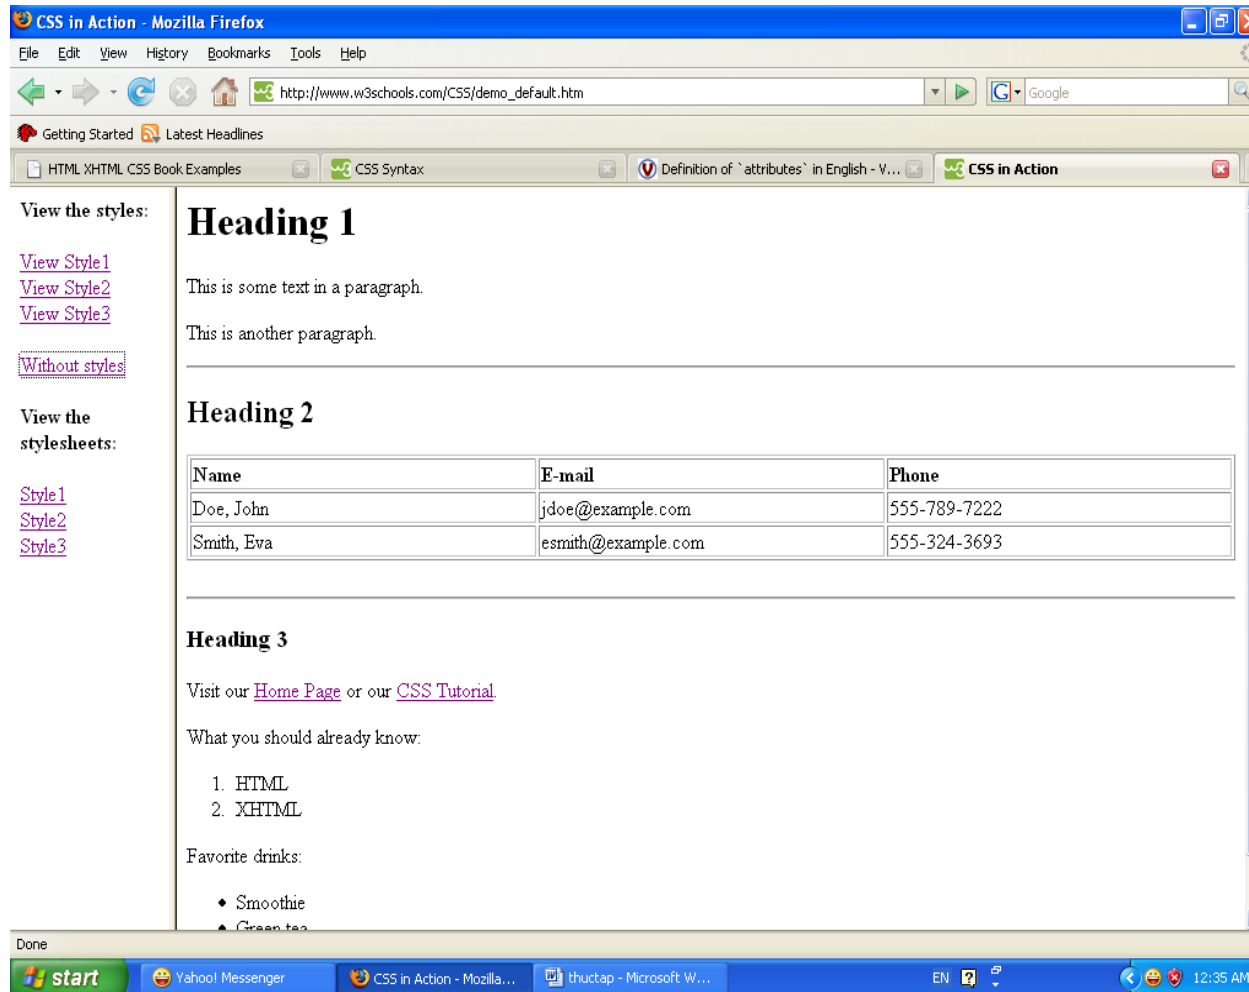

# A document with different style

# Document without style

# Link CSS with HTML

- HTML document contains content of a web page
- CSS document contains the presentation style
- 3 ways for defining a style for a HTML
  - Inline: writing styles mixing with the HTML tags
  - Internal: writing CSS in a style section in the HTML document
  - External: leaving CSS in a separate document and link it with the HTML document

# Link CSS with HTML: Inline

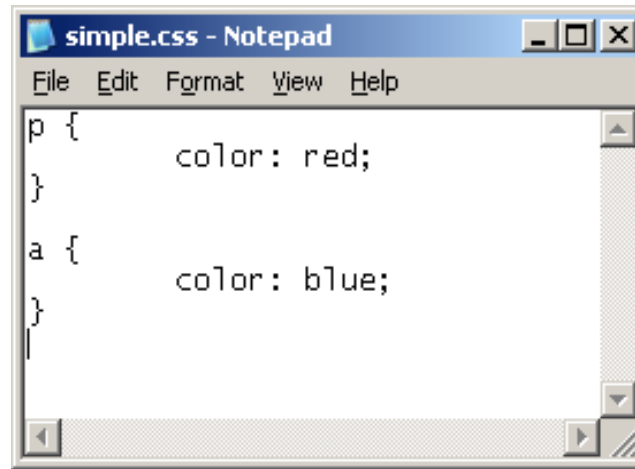

- **In-line** styles are plonked straight into the HTML tags using the style attribute.
- **<p style="color: red">text</p>**
- Style is applied only for the tags containing it
- in-line styles make the HTML document presentation dependant → should be avoided

# Link CSS with HTML: Internal

- **Internal** styles are used for the whole page.
- Styles are defined inside the head section, surrounded by **<style>** tags
- ```
<html>
  <head>
    <style type="text/css">
      p {color: red;      }
      a {color: blue;    }
    </style>
  </head>.
  ....
```
- This will make all of the paragraphs in the page red and all of the links blue.
- Better than in-line styles, the styles and HTML code are more independent by still include in one document

# Link CSS with HTML: External

CSS document

```
simple.css - Notepad
File Edit Format View Help
p {
    color: red;
}
a {
    color: blue;
}
```

HTML document

```

<html>
<head>
  <title>CSS Example</title>
  <link rel="stylesheet" type="text/css" href="simple.css" />
</head>
<body>
  ...
</body>
</html>
```

# Syntax of CSS

- CSS contain rules that defines styles for HTML document
  - Rules define formats of information, data and presentation of the content
  - Rules are associated with HTML elements
  - Rules have a different syntax with HTML syntax
- It is recommended that the HTML tags serving for the presentation such as `<font>`, `<b>` , `<i>` should be not be used

# Rules in CSS

## ■ Rules in CSS contains

- Selector: define the object that the style will be applied

- A HTML tag, a class of HTML tag...

- Style declaration:

- Description of the style

- Syntax

```
selector {attribute1: value1;  
          attribute2: value2;  
          ...}
```

- Example

```
H1 { color: blue}
```

- The selectors can be grouped together

- h1,h2,h3 { font-weight:bold}

# Example of rules in CSS

- `body { background-color: white }`
- `h1 { font-family : sans-serif }`
- `h2, h3, h4 { font-family : cursive }`
- `h2, h4 { color : orange }`

# Different selectors in CSS

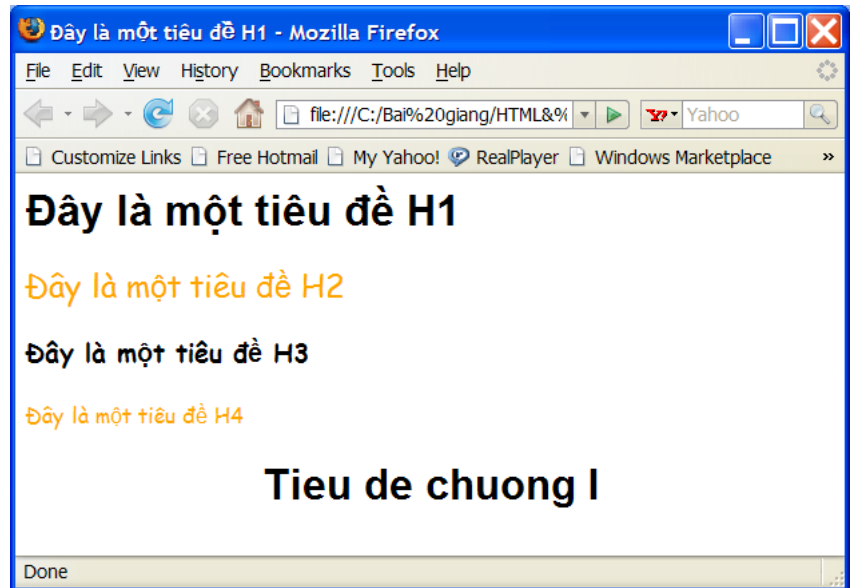

- Selector-type
- Selector-id
- Selector-class
- Selector universal
- Selector pseudo-class

# Selector-type

- The selector is associated with a HTML tag
  - selector {attribute: value}
- Example
  - P {font-size: large}
  - All characters in the paragraph are displayed in large size

# Selector-id

- Selector-id
  - Rule CSS applies for all HTML element that have the given ID
- Syntax
  - #id\_value {attribute: value}
- Ex:
  - CSS:  
#chapter1 { text-align: center }
  - HTML:  
<h1 id= chapter1> Tieu de chuong I </h1>

# Selector-class

- Rule with selector class will be applied for all HTML object that has the given class
- Syntax:
  - .class { attribute: value }
- Example:
  - CSS:  
    .important {color: red}
  - HTML:  
    <h1 class="important"> Important title </h1>  
    <p class="important">  
        This is an important paragraph.  
    </p>
  - All characters in <h1> and <p> are in red.

# Selector-type và class

- Selector-type and class together allows to defines rules for some tags with a given class attribute

- Syntax

- `Tag.class { attribute: value }`

- Ex

- CSS:

- `p.important { color: red; }`
    - `p.brazil {`
      - `color: green;`
      - `background-color: yellow;`
      - `}`

- HTML:

- `<h1 class="important"> Tieu de quan trong </h1>`
    - `<p class="important"> Vi du mot doan quan trong. </p>`
    - `<p class="brazil"> Mau co Brazil </p>`
    - `<p> Day la mot doan khac </p>`

# Selector-universal

- Style with Selector-universal is applied for all objects
- Syntax
  - `* {attribute: value; }`
- Example
  - `*{font-size: large;}`

# Selector Pseudo-class

- Pseudo-class is used to add special effects to a selector when there is user interaction

- Syntax

- `selector:pseudo-class {attribute : value}`
- `selector.class:pseudo-class {attribute : value}`

- Ex

- `a:visited {color: red} /* visited link */`
- Display in red all visited links.

# Selector Pseudo-class

## ■ Pseudo-class

### □ :active

- The pseudo-class that corresponds to the action when user click on the object given in the selector: button, link

### □ :hover

- The pseudo-class that corresponds to the action when users move th cursor over the selector

### □ :link

- selector is a link that have not visited

### □ :visited

- Selector is a link that is visited

# Selector Pseudo-class

## ■ Ex:

a:link { color: red }

a:visited { color: green }

a:hover { background-color: yellow }

a:active { background-color: pink }

# Comment in CSS

- Chú thích trong code
- Begin with "/\*" and end with "\*/"
- Ex:

- File CSS:

```
/* This is a comment */
```

```
p {
```

```
    text-align: center;
```

```
    /*This is another comment */
```

```
    color: black; font-family: arial
```

```
}
```

# CSS attributes for text

Property	Description	Values
<a href="#">color</a>	Sets the color of a text	<i>color</i>
<a href="#">direction</a>	Sets the text direction	<u>ltr</u> , <u>rtl</u>
<a href="#">line-height</a>	Sets the distance between lines	normal, <i>number</i> , <i>length</i> , %
<a href="#">letter-spacing</a>	Increase or decrease the space between characters	normal, <i>length</i>
<a href="#">text-align</a>	Aligns the text in an element	left, right, center, justify
<a href="#">text-decoration</a>	Adds decoration to text	none, underline, <u>overline</u> , <u>line-through</u> , blink
<a href="#">text-indent</a>	Indents the first line of text in an element	<i>length</i> , %
text-shadow		none, <i>color</i> , <i>length</i>
<a href="#">text-transform</a>	Controls the letters in an element	none, capitalize, uppercase, lowercase
<a href="#">unicode-bidi</a>		normal, embed, <u>bidi-override</u>
<a href="#">white-space</a>	Sets how white space inside an element is handled	normal, pre, <u>nowrap</u>
<a href="#">word-spacing</a>	Increase or decrease the space between words	normal, <i>length</i>

# CSS attributes for background

Property	Description	Values
<a href="#">background</a>	A shorthand property for setting all background properties in one declaration	<i>background-color, background-image background-repeat background-attachment background-position</i>
<a href="#">background-attachment</a>	Sets whether a background image is fixed or scrolls with the rest of the page	scroll fixed
<a href="#">background-color</a>	Sets the background color of an element	<i>color-rgb</i> <i>color-hex</i> <i>color-name</i> transparent
<a href="#">background-image</a>	Sets an image as the background	<i>url(URL)</i> none
<a href="#">background-position</a>	Sets the starting position of a background image	top left, top center, top right, center left, center center, center right, bottom left, bottom center bottom right, <i>x% y%</i> , <i>xpos ypos</i>
<a href="#">background-repeat</a>	Sets if/how a background image will be repeated	repeat, repeat-x, repeat-y, no-repeat

# CSS attributes for font

Property	Description	Values
<a href="#">font</a>	A shorthand property for setting all of the properties for a font in one declaration	<i>font-style, font-variant, font-weight, font-size/line-height, font-family</i> , caption, icon, menu, message-box, small-caption, status-bar
<a href="#">font-family</a>	A prioritized list of font family names and/or generic family names for an element	<i>family-name, generic-family</i>
<a href="#">font-size</a>	Sets the size of a font	xx-small, x-small, small, medium, large, x-large, xx-large, smaller, larger, <i>length</i> , %
<a href="#">font-size-adjust</a>	Specifies an aspect value for an element that will preserve the x-height of the first-choice font	none <i>number</i>
<a href="#">font-stretch</a>	Condenses or expands the current font-family	normal, wider, narrower, ultra-condensed, extra-condensed, condensed, semi-condensed, semi-expanded, expanded, extra-expanded, ultra-expanded
<a href="#">font-style</a>	Sets the style of the font	normal, italic, oblique
<a href="#">font-variant</a>	Displays text in a small-caps font or a normal font	normal small-caps
<a href="#">font-weight</a>	Sets the weight of a font	normal, bold, bolder, lighter, 100, 200, ..., 900

# Example

```
<html>
<head>
<style type="text/css">
  p.normal {font-variant: normal}
  p.small {font-variant: small-caps}
</style>
</head>

<body>
<p class="normal">This is a
  paragraph</p>
<p class="small">This is a paragraph</p>
</body>

</html>
```

This is a paragraph

THIS IS A PARAGRAPH

# CSS attributes for list

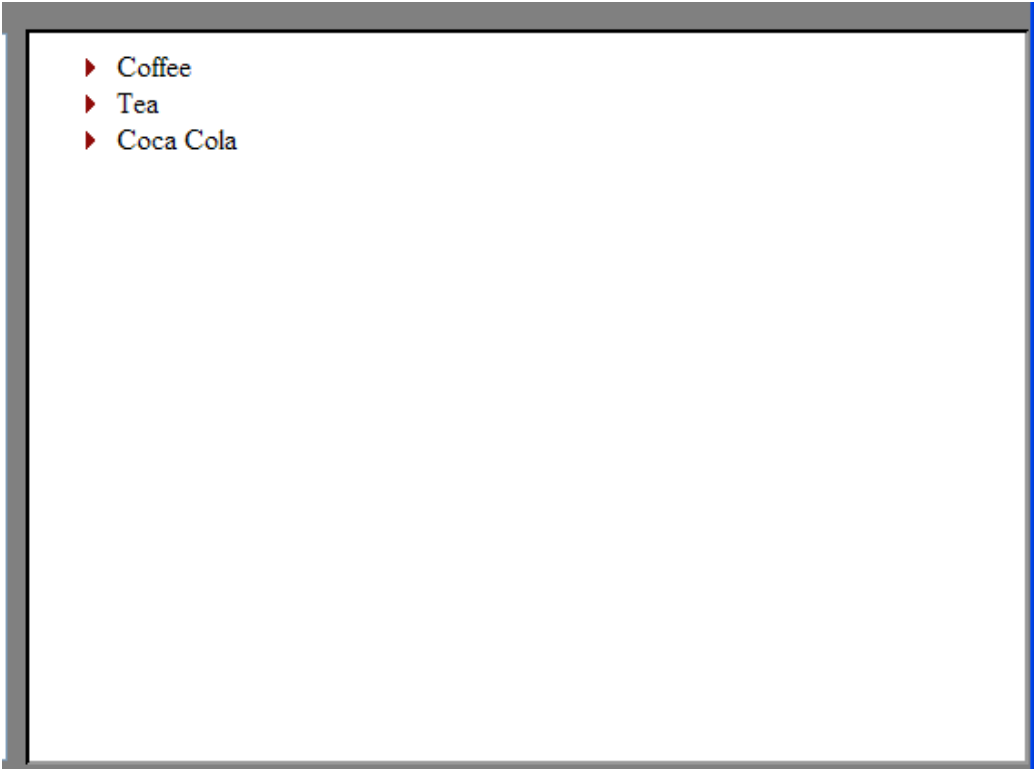

Property	Description	Values
<a href="#">list-style</a>	A shorthand property for setting all of the properties for a list in one declaration	<i>list-style-type</i> <i>list-style-position</i> <i>list-style-image</i>
<a href="#">list-style-image</a>	Sets an image as the list-item marker	none <u><i>url</i></u>
<a href="#">list-style-position</a>	Sets where the list-item marker is placed in the list	inside outside
<a href="#">list-style-type</a>	Sets the type of the list-item marker	none, disc, circle, square, decimal decimal-leading-zero, lower-roman upper-roman, lower-alpha upper-alpha, lower-greek lower-latin, upper-latin <u>hebrew</u> , <u>armenian</u> <u>georgian</u> , <u>cjk-ideographic</u> hiragana, katakana <u>hiragana-iroha</u> , <u>katakana-iroha</u>
marker-offset		auto, <i>length</i>

# Example

```
<html>
<head>
<style type="text/css">
ul
{
    list-style-image: url('arrow.gif')
}
</style>
</head>

<body>
<ul>
    <li>Coffee</li>
    <li>Tea</li>
    <li>Coca Cola</li>
</ul>
</body>

</html>
```

- 
- ▶ Coffee
  - ▶ Tea
  - ▶ Coca Cola

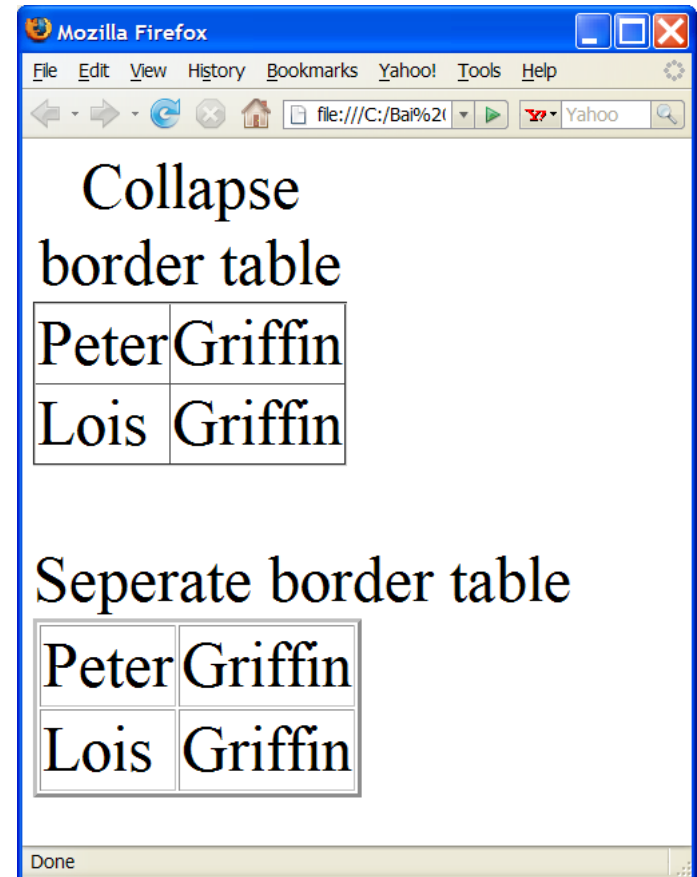

# CSS attributes for table

Property	Description	Values
<a href="#"><u>border-collapse</u></a>	Sets whether the table borders are collapsed into a single border or detached as in standard HTML	collapse, separate
<a href="#"><u>border-spacing</u></a>	Sets the distance that separates cell borders (only for the "separated borders" model)	<i>length length</i>
<a href="#"><u>caption-side</u></a>	Sets the position of the table caption	top, bottom left, right
<a href="#"><u>empty-cells</u></a>	Sets whether or not to show empty cells in a table (only for the "separated borders" model)	show, hide
<a href="#"><u>table-layout</u></a>	Sets the algorithm used to display the table cells, rows, and columns	auto, fixed

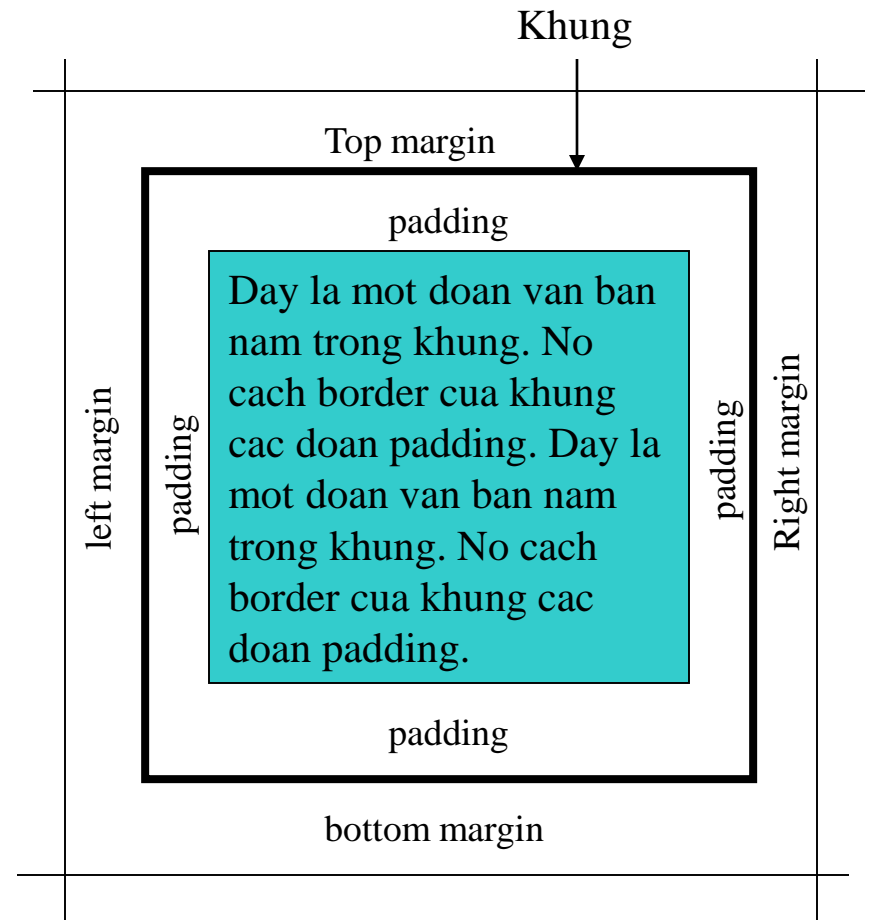

# Example

```
<html>
<head>
  <style type="text/css">
    table.coll { border-collapse: collapse }
    table.sep { border-collapse: separate }
  </style>
</head>
<body>
  <table class="coll" border="1">
    <tr> <td>Peter</td> <td>Griffin</td> </tr>
    <tr> <td>Lois</td> <td>Griffin</td> </tr>
  </table>
  <br />
  <table class="sep" border="1">
    <tr> <td>Peter</td> <td>Griffin</td> </tr>
    <tr> <td>Lois</td> <td>Griffin</td> </tr>
  </table>
</body>
</html>
```

# Frame model

- Some HTML elements are displayed in a frame
  - H1, h2, p, ul, li, div

# Frame model- Border

- The border of the frame can be displayed with different color and style
- Characteristic of the border
  - Width : width of the border
    - thin,
    - medium,
    - thick
  - Style : style of the border
    - solid,
    - dashed,
    - dotted, etc
  - Color: color of the border

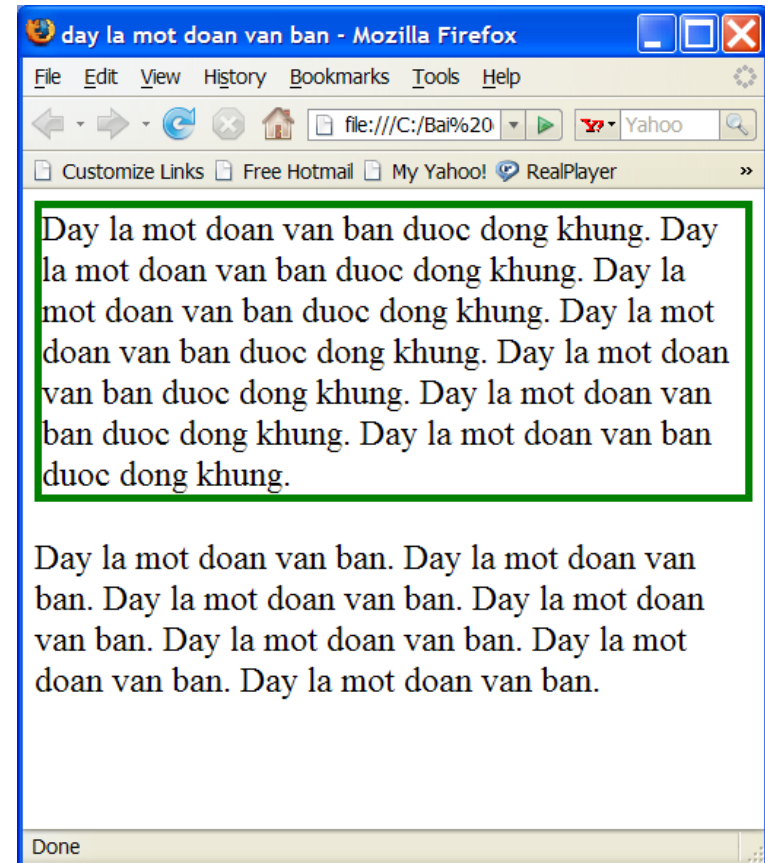

## ■ Example

```
{
  border: thick solid green;
}
```

width

style

color

# Frame model- Border

- Characteristic of the border can be defined with different attribute:

- ☐ border-width
- ☐ border-style
- ☐ border-color

- The previous example is equivalent with:

p.different

{

border-width: thick;

border-style: solid;

border-color: green;

}

# Frame model - Border

- Four edges of the border can be displayed differently
- Each attributes have 4 values corresponding to 4 edges of the border
- Ex:

p.four\_borders

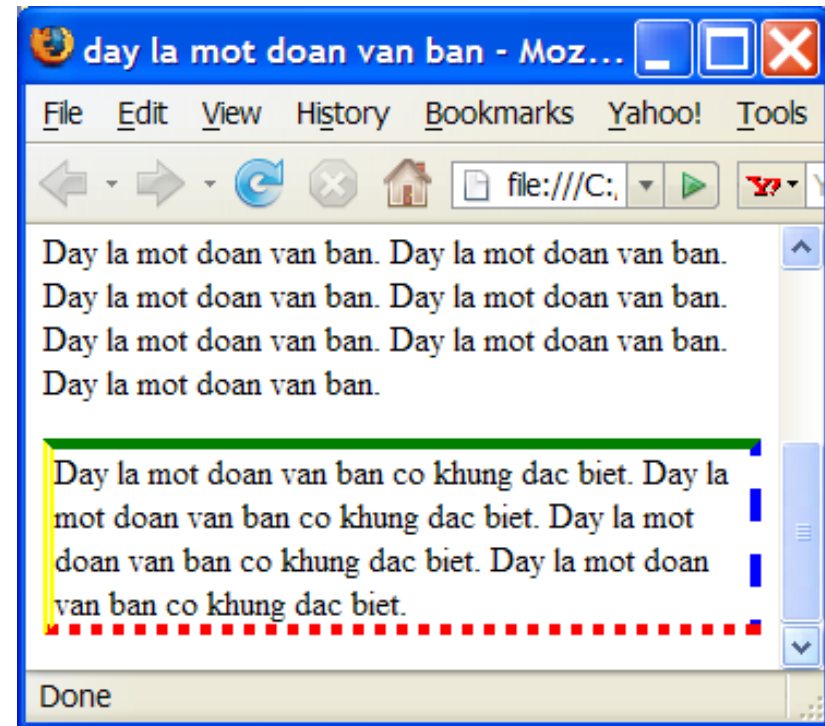

{

border-width: thick;

border-style: solid dashed dotted double;

border-color: green blue red yellow;

}

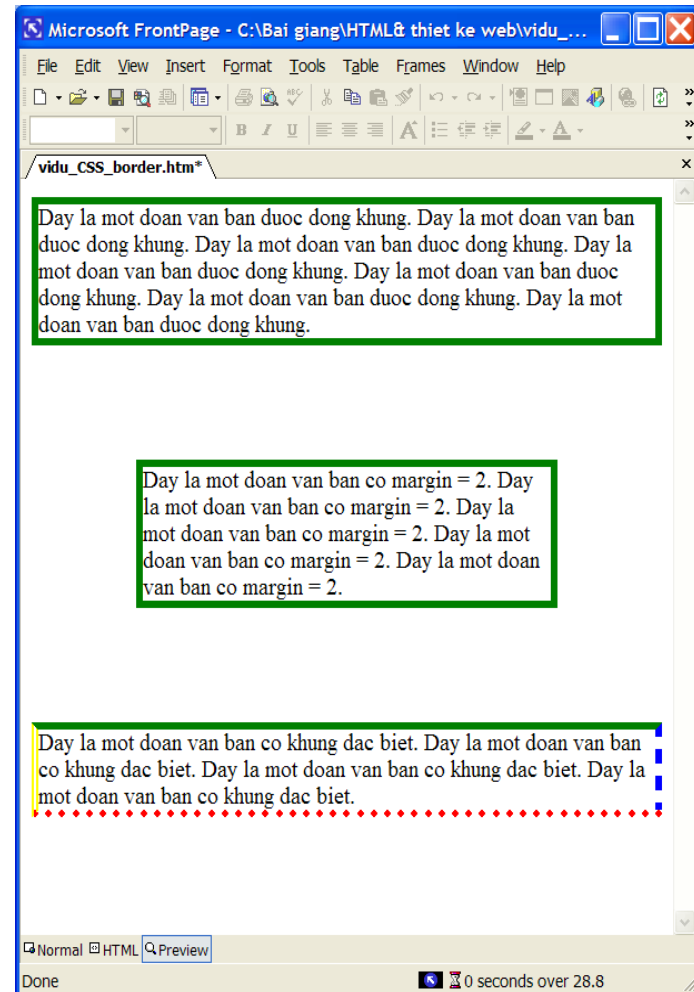

# Frame model- Margin

```
■ p.conclu
{
    margin: 2cm 2cm 2cm 2cm;
}
```

This rule is equivalent with

```
■ p.intro
{
    margin-top: 2cm;
    margin-left: 2cm;
    margin-right: 2cm;
    margin-bottom: 2cm;
}

■ Default value of the margin is 0.
■ Values of margin can be defined by %.
```

# Frame model- Margin

- Values for margin can be  $<0$ , it makes text overlapping
- `p { margin : 5px 10% -5px;}`

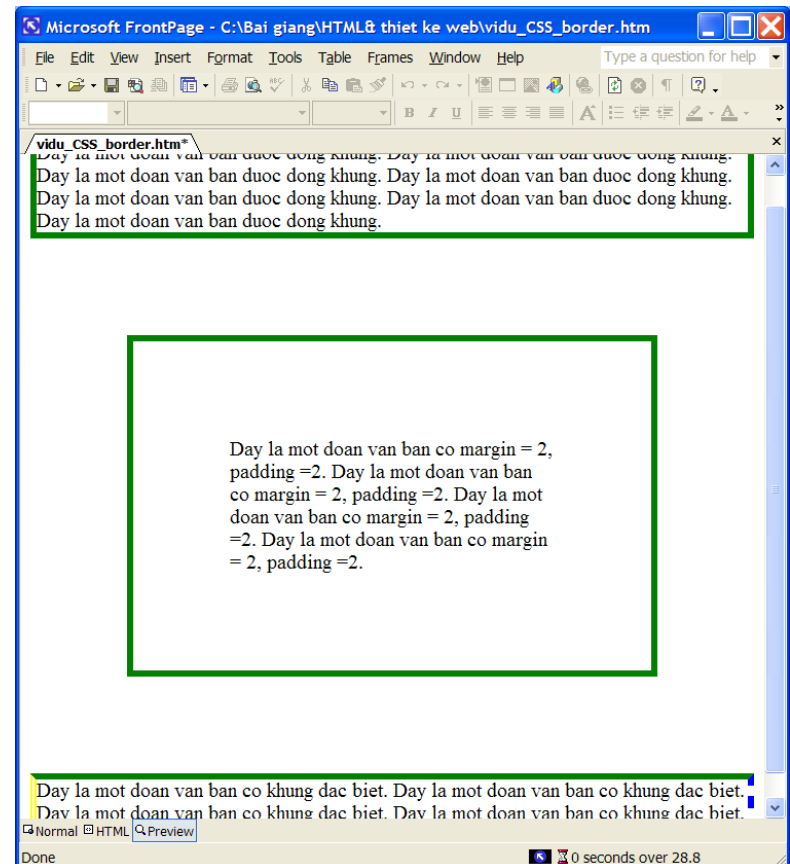

# Frame model - Padding

- Padding define the distance between the content and the border
- Attributes of padding are defined similarly to margin, however the value cannot be negative
- p.intro

```
{  
padding-top: 2cm;  
padding-left: 2cm;  
padding-right: 2cm;  
padding-bottom: 2cm;  
}
```

- Equivalent to:

```
p.conclu  
{  
padding: 2cm 2cm 2cm 2cm;  
}
```

# Frame model - Alignment

- Attribute text-align allows to align the text within a frame
- Text-align can be: left, right, center, justify
- Ex:

p.intro

```
{  
    text-align: right;  
}
```

p.conclu

```
{  
    text-align: justify;  
}
```

# Frame model - Indentation

- Indentation attributes allow defining the right shift space at the beginning of the line

- Ex

```
p  
{  
text-indent: 1cm  
}
```

All paragraphs are 1cm right shift

# Frame model- line-height

- line-height defines the height of a line including the height of its characters and the space with another line

- Ex:

```
p.p2
```

```
{
```

```
    line-height: 1.5;
```

```
}
```

# Frame model – width, height

- Width and height define the width and the height of a frame
- Width and height can receive values in
  - Number of pixel: 300px
  - Cm : 5cm
  - %, relative values with the width or the height of browser window. Ex: 50%

# Division

- <Div> define a regions of code in HTML file
- <div id =“...”>

....

</div>

- Tag <div> is used to divide a HTML file in zone for applying different styles for each zone later
- Ex:

<html>

<body>

<div id = “modau”> ...</div>

<div id = “noidung”>...</div>

<div id =“ketluan”>...</div>

</body>

</html>

# Frame model: Float

- Float defines how a HTML element should be aligned in comparison with its parent.
- Ex:
  - CSS:

```
#section2 {  
    float: right;  
    width: 300px;  
    background-color: yellow;  
}
```

# Frame model: Float

□ HTML:

```
<body>
<div id="section2">
  <ul>
    <li><a href="http://umontreal.ca"> UdM</a>
    </li>
    <li><a href="http://desi.umontreal.ca"> DESI</a>
    </li>
    <li><a href="http://w3.org"> W3C</a>
    </li>
  </ul>
</div>
<div id="section1">
<p> Day la mot doan van ban. ...
</p>
</body>
```

- section2 is aligned in the right of <body> and pushing the content to the left.

# Page formatting

- Left column occupies 30% page width

```
#section1
```

```
{  
    float:left;  
    width: 30%;
```

```
}
```

```
#section2
```

```
{  
    float:right;  
    width: 70%;
```

```
}
```

- Head and foot sections are not floating and occupy all the page width

```
#foot, #header
```

```
{  
    clear:both;  
    width: 100%;
```

```
}
```
